Background

The Office of Personnel Management (OPM) Office of the Inspector General (OIG) requires an investigative tracking system (ITS) to track, manage, and process investigative data related to the OPM OIG's oversight work—specifically its criminal, civil, and administrative investigations and related law enforcement processes. This ITS will provide core support for the OIG mission and audit trails of OPM OIG investigative activities.

Proper handling of investigations and related oversight activities requires collection and organization of relevant information, tracked processing of cases, and recording of required and elective activities, statistics, and information. The OIG must also generate reports in a variety of formats for a variety of stakeholders to meet a range of requirements (both statutory and ad hoc) and schedules.

The ITS provides core support for the OIG mission. Therefore, the ITS must meet all requirements outlined in this statement of work and its attachments.

Scope

The OPM OIG is seeking a commercial off-the-shelf (COTS) system to process OIG investigations from initial allegation/complaint input to final disposition. The system must be customizable by OIG developers/staff to meet the needs of the OIG, including field changes and additions to the database. The contractor will provide technical support and maintenance of the product. All work by the contractor must be performed in compliance with federal regulations.

System Requirements

The system must meet all of the statement of work's requirements and the requirements of Attachment A: Technical Requirements.

Additional Requirements

The system must be a cloud-based application hosted by the vendor and available to the OPM OIG throughout the country. The system must support at least 30 concurrent users. The system must be fully complaint with the Federal Information Security Management Act (FISMA) requirements and OPM OIG network and security requirements.

Because the ITS will be a system of record, it must maintain data integrity while also being easily editable.

The ITS must be able to incorporate legacy data from the legacy ITS into the new system, as determined by the OPM OIG.

Software Maintenance, Installation Support, Technical Support

The system vendor will provide software maintenance, installation support, and technical support. The vendor will also supply system administration manuals, and training for functional users and administrative users to the OPM OIG.

Deliverables

The deliverables for this effort are:

- a COTS product satisfying the requirements of this statement of work and all attachments.
- training for OPM OIG users and administrators.
- a minimum of four sets of printed User, Administrator, and Training documentation packets, as well as digital copies of each. These documentation packets must meet all the requirements of the attachments to this statement of work and must include all instructions a user, administrator, or trainer needs to operate the software independent of vendor support.

System Requirements

The system must meet the detailed requirements found in Attachment A.

The system must support a total of 30 user licenses per application, included in the purchase price, when installed. The userbase for these concurrent licenses will be administered by OPM OIG support personnel.

Government-Furnished Equipment

The government will provide the necessary computers, printers, and local area network connectivity to the OPM OIG's network for completion of the project.

Task Requirements

The contractor will, in coordination with government staff at OPM OIG headquarters, lead in succession a requirements-gathering team, an implementation team, and a training team. The work locations for these teams will be decided by the OPM OIG, but it is expected to be at OPM OIG headquarters with the possibility for alternate training sites, based on agency need.

During the requirements-gathering phase, the vendor will analyze and review OPM OIG processes and documentation and make recommendations to the OPM OIG for the ITS' application configuration requirements. Representatives from the OPM OIG OI must be involved during this requirements analysis. The vendor will provide their findings and recommendations in writing and will review the recommendations with OPM OIG. After the OPM OIG has agreed to any recommendations, the vendor will configure the application to the satisfaction of the OPM OIG.

The vendor will provide an implementation/project plan to the OPM OIG that includes the analysis of OPM OIG business processes, understanding of the incumbent ITS configuration, recommendations for the configuration of the new system, and documentation of configuration. This implementation plan will also include a schedule for the vendor to implement the system, including scheduled performance meetings and other milestone meetings.

The vendor will provide both user training and system administration training to relevant OPM OIG staff. The delivery method of training will be decided by the OPM OIG.

Period of Performance

The proposed period of performance is 18 months, beginning upon receipt of the Letter to Commence. The vendor's project plan is due within 2 weeks of the contract award.

During the period of performance, the OPM OIG and vendor will hold performance evaluation meetings approximately every 2 weeks, as well as performance quality evaluation meetings as necessary. Task quality levels will be assed by the OPM OIG based on pass/fail evaluation. The vendor must provide a Corrective Action Plan within 5 days of notice of defective performance. If the quality level is disputed and a resolution cannot be reached, the OPM OIG will elevate the dispute to the contracting office representative (COR) for a decision.

Security

This effort and reports related to it are expected to contain highly sensitive information that could act as a guide for hostile entities to harm the OPM OIG's critical infrastructure. Therefore, any information (in any format) made available to the contractor must only be used per the provisions and goals of this agreement and not divulged to unapproved people or parties. All security reports are "for official use only" and must be labeled as such. The vendor must immediately notify the OPM OIG and the COR upon discovery of any inadvertent disclosures of information. The vendor will not retain any information about

vulnerabilities (including summaries, actual vulnerability reports, or any other data/information) at the end of the task order. All information from this task, whether hardcopy or electronic, will be returned to the government at the task's conclusion.

The vendor will provide product upgrades/releases, bug fixes, and changes needed to stay compliant with federal information regulations. This includes corrective and adaptive maintenance. The vendor will fully test software patches and upgrades prior to installation and make the test results available to the OPM OIG.

The vendor must provide evidence that its personnel have satisfactorily passed background investigations and provide the OPM OIG with the results and the requirements for satisfactory completion of the investigation. The vendor will not disclose sensitive or proprietary information of or in the possession of the OPM OIG or its contractors, vendors, or business partners to unauthorized people. The vendor is subject to all penalties imposed by law for unlawful disclosure of OPM OIG information.

Personnel Requirements

Key Personnel: Project Manager

The vendor will designate a project manager for the task effort. This project manager will have full authority to act for the vendor on all contractual matters relating to daily operations of this contract. Replacement of the project manager will only be done with the approval of the OPM OIG. Resumes for replacement personnel are required within 5 days before the start date of the new personnel. The OPM OIG will respond within 5 days to any request to change the project manager.

Removal of Unsatisfactory Personnel

If personnel must be replaced for any reason, including performance that the government determines is unsatisfactory/unsuitable, the OPM OIG may request immediate replacement. Upon receiving the request, the vendor will remove the personnel and within 5 days provide acceptable replacement resumes that equal or exceed the qualifications of the previous personnel.

Nondisclosure Agreements

Standard nondisclosure agreements are required for system administration personnel who may have access to government data in the course of their duties.

Government Testing and Acceptance

The COR will review for completeness all draft and final work products and deliverables that the contractor submits. The COR may return them to the contractor for correction. Absence of any comments by the COR does not relieve the contractor of its responsibility to comply with the requirements of the contract.

The government will perform acceptance testing of the ITS. Items found to be unacceptable in performance during acceptance testing will be provided in writing to the contractor. The contractor will provide a timeline to remedy any unacceptable work discovered during performance acceptance testing. The government must sign off on its acceptance of any corrections or improvements that remedy earlier findings of unacceptable work during acceptance testing.

Appendix A: Technical Requirements

This appendix outlines the technical requirements for the OPM OIG Investigative Tracking System.

Security

S1. The system must meet or exceed all OPM IT and OPM OIG security policies and any additional agency standards for an information technology system.

S2. The system must comply with all applicable federal laws and regulations. This includes but is not limited to FISMA, OMB memoranda, FedRAMP, FIPS, and NIST-SP.

S3. The system must adhere to the minimum security requirements in NIST's FIPS 200, *Minimum Security Requirements for Federal Information and Information Systems*, and the corresponding security controls described in the current version of NIST Special Publication 800-53, *Security and Privacy Controls for Information Systems and Organizations*. Furthermore, the system must adhere to the security control baseline requirements associated with the appropriate FIPS 199, *Standards for Security Categorization of Federal Information and Information Systems* (i.e., high, moderate, or low). The OPM OIG will determine the security categorization and must obtain authority to operate by OPM.

S4. The system must meet or exceed the security requirements of a Moderate-impact system as defined by FIPS 199. The vendor must demonstrate compliance based on the appropriate categorization and its adherence to OPM requirements for IT systems.

S5. To obtain authority to operate, the system must comply with OPM security assessment and authorization policies and guidance. The vendor must complete the required security documentation (e.g., using the OPM security documentation templates and following the OPM authorization checklist to ensure oversight of the process). The vendor must complete any other requirements (e.g., completion of a privacy impact assessment) per OPM guidelines.

S6. The vendor must have an offsite alternative processing location outside of a 100-mile radius from Washington, DC.

S7. The vendor will identify all infrastructure components required to operate the primary and backup system, including components required to support data import and export; system monitoring and management; system installation; and system administration. The vendor must provide this information in writing.

S8. The vendor will provide a backup and disaster recovery plan that enables a switchover to an active or hot passive backup system at a secondary site without disrupting operations. The vendor will provide this plan in writing.

S9. The system must allow scheduled jobs (such as user lockouts) based on schedules defined by the OPM OIG. The system must have the ability to automatically end or time out user sessions after a specified length of time. The system must limit to one session per user at any given time.

S10. The system must use role-based permissions to control security and access to records.

S11. Appropriate OPM OIG personnel must be able to add/disable users, assign/change roles, define permission-based roles, and perform other administrative functions without the contractor or an information technology specialist.

S12. The vendor must comply with FISMA and OPM policy standards that require people handling or operating government information systems to protect the information and system against unauthorized access, use, disclosure, disruption, modification, or destruction. In addition, all information stored in a cloud environment is the property of the OPM OIG, not the contractor or cloud service provider. The OPM OIG retains ownership of the information. The cloud provider does not have the right to OPM information for any purposes other than those explicitly stated in the contract.

S13. The system must comply with the National Archives and Records Administration's Electronic Information Management Standards and have records management capabilities that meet the applicable standards built into the system design.

S14. The vendor will notify the OPM OIG system administrator within 1 hour of a suspected cyber incident. ("Cyber incident" is defined by FISMA.) If a cyber incident occurs, the vendor must work with the relevant federal incident response personnel to identify the scope and vector of the incident and remediate the incident and its cause.

S15. The system must have a virus-checking function that applies its scan before any attachments or forms are transmitted into the system.

S16. The system must only be accessible via a static or range of static IP addresses.

S17. The system shall have the ability to support OIDC and/or SAML for user authentication from an external Identity Provider.

S18. The system shall have the ability to send logs to Microsoft Defender for Could Apps, either via a native connector or securely sending logs via SFTP.

Privacy

P1. The system must comply with the Privacy Act of 1974's rules and regulations in the design, development, or operation of any system of records.

P2. The system must adhere to OPM policy protecting Personally Identifiable Information. It must restrict sending, copying, or moving PII from the OPM network as necessary. The system must ensure PII is not inadvertently disclosed to unauthorized individuals. The system will not send PII in the body of an email. Attachments containing PII will be encrypted.

P3. The OPM OIG will own all data and related metadata residing in the system.

P4. The system must comply with the HIPAA Security Rule (title 45 Code of Federal Regulations part 160 and part 164, subparts 160–164) to protect the privacy of individually identifiable health information. The system must protect electronic personal health information created, received, used, or maintained by a covered entity. The Security Rule requires appropriate administrative, physical, and technical safeguards to ensure the confidentiality, integrity, and security of electronic protected health information.

P5. The system must comply with the HIPAA Breach Notification Rule (45 Code of Federal Regulations part 164.400–414), which requires HIPAA-covered entities and their business associates to provide notification following a breach of unsecured protected health information.

Data Migration

DM1. The system must provide a solution to import legacy case information, including but not limited to entity fields, result fields, case fields, and individual case chronology entries by case.

DM2. The system must provide a solution for importing legacy case documents in a variety of standard file formats such as .docx, .doc, .jpeg, .wav, and .pdf. Importation must include metadata (upload date, description, user, etc.).

DM3. The vendor must develop proof of concept for migrating data from the current system to the new system before the planned operational date of the new system.

DM4. The vendor must develop a System Implementation Plan for the transition from the current system to the new system. This plan must address data restructuring, data and system migration, and data conversion from legacy systems. It must also provide a plan for reestablishing legacy systems if problems arise during implementation. The vendor will obtain plan approval from the OPM OIG prior to implementation.

Maintenance and Technical Support

MT1. The vendor must have clearly documented processes for requesting changes to the system, managing the system, and maintaining the system (e.g., ticketing system style change request system and management).

MT2. The vendor will have clearly documented System Support Service Level Agreements for maintenance and service requests. This must include timeframes.

MT3. A cloud Platform as a Service (PaaS) model will host the system.

Configuration

C1. The system will provide a user interface that is modern, simple, consistent, and intuitive for all case management functions and related functions. The system must be scalable to allow for the addition of new fields, controls, and/or functionality without the need to redesign the webpage or change source code. The system will present users with actions and information valid for their assigned predefined roles. The user interface will provide guidance through dropdown menus and clear directions as well as real-time validation on formatted data entries (compared to free-text data entry). Users must be able to backtrack and revise previously entered data. The system must use a web client with no support installation files.

C2. The system must be accessible and run exclusively on a web browser.

C3. The system must allow at least 30 concurrent licensed users to use the ITS at the same time.

C4. The system will provide technical capabilities for the OPM OIG to monitor performance to ensure the system meets OPM OIG needs without rearchitecting or redesigning the system.

C5. The system must support the increase or decrease of users, user workloads, and user locations while maintaining the system's performance levels and user response times. This scalability must not require new or modified coding. It must be accomplishable via infrastructure and/or configuration modifications.

C6. The system must be scalable to meet changes of OPM OIG or federal requirements.

C7. The system architecture must be capable of interfacing with internal and/or external systems.

C8. The system must have the ability to automatically complete a company entity screen based on a search of the System for Awards Management (SAM) using the SAM application programming interface (API).

C9. The system must provide technical capabilities (e.g., APIs, web, or data services) to allow users to import or export case-related data from or to other external government systems using standard protocols and formats.

C10. The system must provide the technical capability to integrate/interoperate with Microsoft Office products and Adobe PDFs to support system document preparation.

C11. The system must have the capability to define roles and associated privileges, including access control capabilities. Privileges must include the ability to assign specific users to the profiles.

C12. The system webpage will fully render inside a user's web browser within 2 seconds at least 23 hours a day.

C13. The system must be fully feature capable on Google Chrome and other web browsers as determined by the OPM OIG.

C14. The system will not require the client browser to have either Adobe Flash enabled or Java locally installed.

C15. The system must be scalable so that OPM OIG staff can add custom fields to case pages or individual/entity screens without the assistance of the contractor or an information technology specialist. The addable fields must include (at minimum) text boxes, text areas, checkboxes, date boxes, multiselect pick lists, dropdowns, number fields, and fields supporting data validation.

C16. The system must have configurable field labels and messages alterable to match the OPM OIG/organization's standard terminology.

C17. The system must have a customizable home page dashboard based on user role.

C18. The system dashboard must visually present/represent case information and reports based on user role/customization.

Development

D1. One vendor will supply the system. The OPM OIG must approve any subcontractors.

D2. The vendor will identify all commercial off-the-shelf (COTS) software and hardware products (including third-party hardware or software) that are required components of the system. The vendor will describe the component architecture, high-level design, data/information flows, and system controls.

D3. The vendor will resolve any technical Plans of Action and Milestones (POAMs) issued specifically to the product.

Document Management and Records

DMR1. The system must have the technical capability to upload, store, and attach documents and various types of media files to an investigative case. The system must generate metadata for unstructured documents and media files and include this metadata in case-related queries. The case management system must provide technical capabilities to enable users to restrict access to specific media files (e.g., photographs or audio files).

DMR2. The system's role-based permissions must be able to assign read-only or read–write access to cases and to fields within a case.

DMR3. The system must limit information editing in a case based on the case status (e.g., not allowing edits to fields after a case is closed).

DMR4. The system must support the upload of all industry-standard document, audio, video, and picture file formats and types.

DMR5. The system must be able to display common special characters (e.g., ampersands and asterisks) without loss of functionality or disruptive effects on text boxes, attachments, or other field entries.

DMR6. The system must have a consistent case numbering system/naming convention.

DMR7. The document section must support Web Distributed Authoring and Versioning (WebDAV) to enable online creation, editing, and version control for standard Microsoft Office products (e.g., Word, Excel, and InfoPath).

DMR8. The system must have a spellcheck/advanced word processing features for text entries, including a mechanism to recognize variants of duplicate naming (e.g., U.S. OPM vs. US OPM). It must flag or correct duplicates, have autocomplete functions or predictive text, etc.

Workflow, Permissions, and Notifications

WPN1. The system must automatically trigger notifications (e.g., emails) and/or dashboard indicators to users as determined by the OPM OIG.

WPN2. The system will provide the capability for users to limit/control user access to case-related information (e.g., grand jury material).

WPN3. The system automatically notifies all appropriate users after entries are submitted, based on workflow processes determined by the OPM OIG.

WPN4. The system provides the ability for appropriate users to review data and documents before the documents are added to the case management record, based on OPM OIG procedures and rules.

WPN5. The system must link a user to relevant (based on role) report pages via the dashboard.

WPN6. The system will enable (or have the capability to enable as a future enhancement) users to extract and transfer system data to a data warehouse and then import data back into the system.

WPN7. The system must have a notification system that can define circumstances for role-based or event-driven notifications as determined by OPM OIG (e.g., sent via email and/or appear on the user dashboard.)

WPN8. The system must link the investigation number to the preliminary inquiry number, if different.

WPN9. The system must allow all information from the preliminary inquiry to be accessible and editable after conversion to an investigation.

WPN10. The system dashboard must have shortcuts to popular system functions (e.g., timesheets, advanced search). Users must be able to customize their shortcuts from the system options.

WPN11. The system will have a user-customizable Home Page/Landing Page dashboard. This dashboard must show notifications for the user's workflow tasks.

WPN12. The system dashboard must provide notifications/updates/bulletins tracking the timelines of required tasks. The system must provide visual reminders (e.g., badges) to emphasize the time remaining to complete a task before it is overdue and/or display the duration the task is overdue.

WPN13. The system must automatically trigger actions, including notifications and dashboard indicators.

WPN14. The system must display notifications in the ITS dashboard and send corresponding notifications for all workflow tasks.

WPN15. The system must have policies and procedures to define the roles and responsibilities for workflow management. The business rules (workflow) engine must be triggerable based on database activity.

WPN16. The system must be able to link cases, documents, and subject records to each other. For example, the system must be able to link records if one contractor submits a notification identifying a subject and a second contractor provides a similar notification and identifies the same subject.

WPN17. The system must verify that a user has entered specified/required information prior to allowing a case to close.

WPN18. The system must have an administrator role with the permission to toggle on/off notifications for certain activities.

WPN19. The system must prevent cases from being "unassigned" (i.e., not assigned to any staff member) and must require cases be transferred from one staff member to another if primary/all staff are removed from a case.

WPN20. The system must allow users to electronically sign and date approved documents. The signed document must be converted to an un-editable and searchable PDF and saved as the only version of the document. The system must eliminate earlier drafts of the report and notes between users. If the report is modified, the system must revoke the approved status and return the document to a pending review status.

WPN21. The system must, based on templates provided by the OIG, force specific formatting rules within a document (e.g., same font style, letterhead) and preserve original formatting when text is copied and pasted from outside the application. For example, if text is written in Microsoft Word and pasted into the report template within the system, the system must maintain the formatting so that users do not have to reformat the pasted text.

WPN22. The system must be able to populate data into standardized forms, templates, reports, and other case management workflows.

WPN23. The system must have an evidence tracking system that allows evidence to be assigned to cases, sequentially labeled, include identifiers described by staff, etc.

WPN24. The system must allow the administrator to set default settings for word processing/templates, etc. (E.g., default font, text size, spacing) and the creation of word-processor-exportable templates.

WPN25. The system must allow users with administrative privileges to move items through workflow processes (forward and backward) without needing to assign or sign workflow items.

WPN26. The system must have an enhanced inbox/tracking inbox (including timeliness and deadline notifications).

WPN27. The system must allow certain user roles to delegate permissions or approvals to other users/roles.

WPN28. The system must have the ability to convert cases to different types and transfer all information from the previous case type to the new case type.

WPN29. The system must allow for task delegation (including approvals) to subordinate or lateral role users (e.g., detailed supervisors or temporary positions)

Hotline, Whistleblower, and Carrier Portal Workflow

HWC1. The system must log all preliminary inquiries received by the OPM OIG, regardless of the source.

HWC2. The system must be able to create a preliminary inquiry from a Hotline contact.

HWC3. The system must have the ability to create an investigation from a preliminary inquiry.

HWC4. The system must allow for receiving/have the ability to receive external communication from identified entities (a public-facing but restricted portal) for the receipt of carrier notifications from FEHBP/FEDVIP insurance carriers. The system must be able to provide automated response messages to submitters.

HWC5. The system must allow for/have the ability to receive external communications from the public in order to receive Hotline complaints. These complaints will be submitted via online form and provide automated response messages to submitters.

HWC6. The system must allow for/have the ability to receive external communications from the public in order to receive Whistleblower complaints. These complaints will be submitted via online form and provide automated response messages to submitters. Received complaints must have a different workflow to match whistleblower law protections.

Electronic Filing

EF1. The system must assign a system-generated case number and case title based on OPM OIG naming conventions for various case types. The OPM OIG will determine the exact naming conventions.

EF2. The system must allow OPM OIG staff to submit predefined formatted documents (subpoenas, etc.) used in electronic filings. The required case initiation data elements must come directly from the document.

EF3. The system must provide date and time stamps for electronic filings and other documents, as determined by the OPM OIG (e.g., timestamp for when received, timestamp for when reviewed). Some documents may require multiple date/time stamps.

EF4. The system must have the ability to receive and file documents that are not associated with any case (e.g., FOIA requests).

EF5. The system must have a list of configurable document types that will be considered part of the actions for a specific case or for multiple cases when the documents are manually or automatically transmitted or received.

EF6. The system must provide the forward migration of all documents.

EF7. The system must have automated acceptance and rejection of submissions and documents using the form and substance requirements of the OPM OIG.

EF8. The system must notify the user of whether a file is accepted or rejected, including the reason for rejection, if applicable.

EF9. The system must maintain a register of authorized users and identifiers. The system must support registration/authorization processes for contractors, other agencies, health insurance carriers, and other authorized users to submit electronic court filings and other documents.

EF10. The front-end system must validate form elements required for populating the database. The system must also provide error messages for the user if an entry does not meet OPM OIG policies or requirements.

EF11. If the system is offline or not operational, the frontend electronic filing system must immediately message the filer and hold the filing for submission when the system resumes operations.

EF12. The system must assign and confirm a unique identifier for each submission and allow the filer search using the identifier and receive status updates.

EF13. The system must electronically send notices or alerts. (The OIG will provide minimum standards/occasions for when notices/alerts must be sent.)

EF14. The system must send notices (template or ad hoc) to a submitter who must take additional action after initial review.

EF15. The system must identify and prevent duplicate entries for specific/unique fields such as subject personal identifiers. The system must standardize entry and linking of records.

EF16. The system must perform automated address standardization/verification.

Training Management

TM1. The system must have the ability to track and manage training records.

TM2. The system must provide the ability to personalize leaning plans (e.g., on-the-job training plans) by individual group or role. The system must track progress on the learning plan.

TM3. The system must integrate course booking with procurement.

TM4. The system must store, track, and report on training completed via a variety of methods (e.g., classroom, in-person, online).

TM5. The system must have the ability to accept uploaded training certificates or other applicable forms (e.g., request forms, firearm qualification score sheets) and the ability to customize other required information fields for each training record.

TM6. The system must have the ability to assign required or recommended training by individual, role, group, or job function.

TM7. The system must provide the ability to search training records by name, course title, training provider, completion date, or expiration date, and to set

permissions by role (e.g., supervisor can view own records and all records of users they supervise).

TM8. The system must provide the ability to create, assign, and schedule forms that users may have to complete and import information into the forms.

TM9. The system must store, track, and report on training completed via a variety of methods (e.g., classroom, in-person, online).

TM10. The system must have the ability to accept uploaded training certificates or other applicable forms (e.g., request forms, firearm qualification score sheets) and the ability to customize other required information fields for each training record.

TM11. The system must have the ability to assign required or recommended training by individual, role, group, or job function.

TM12. The system must provide the ability to search training records by name, course title, training provider, completion date, or expiration date, and to set permissions by role (e.g., supervisor can view own records and all records of users they supervise).

TM13. The system must provide the ability to create, assign, and schedule forms that users may have to complete and import information into the forms.

TM14. The system must be able to categorize training types and create profiles for repeated training (e.g., annual ethics training).

TM15. The system must automatically set general reminders and notify individual users or a selected group of users when courses are scheduled, cancelled, or approaching expiration. The email format must be customizable.

TM16. The system must allow users to perform course evaluations and to provide/receive course feedback.

TM17. The system must automate scheduling and identify employee training needs by individual, role, group, or course.

TM18. The system must record training credits, training hours, and assessment scores.

TM19. The system must track training costs by individual, role, group, course, category, or supervisor.

TM20. The system must be able to export data and customize reports to various formats (e.g., Excel spreadsheet) based on user-specified parameters (e.g., region, user, training type, time period). The system must be able to save the reports for future use.

TM21. The system must allow users to create a training record or request training (course name, hours, completion date, category, and expiration date) and

attach supporting documents. The system must route the training record for approval.

TM22. The system must allow specific training entries and certifications to have expiration dates set by certain power users.

TM23. The system must have the ability for users with the appropriate permissions to create multiple records from one form. This will include date of training, the training type that occurred, total hours, results of training (e.g., pass/fail), users who attended, and instructors.

TM24. The system must allow for exception searches for both training and inventory to find incomplete or erroneous data in these categories.

Time and Labor Tracking

TLT1. The system must be able to create a defined list of non-case activities for staff to charge time to (e.g., training, unscheduled overtime, travel) and the OPM OIG must have the ability to define, edit, and update the list as necessary.

TLT2. The system must allow users to assign time to specific activities/cases.

TLT3. The system must calculate excepted hours/LEAP hours and track them within the timesheet.

TLT4. The system must provide users the ability to document accurately their hours worked each month. This includes regular work hours, unscheduled overtime, undercover work hours, etc. The time entries must be attributable to case or non-case activity. The system must provide the mechanism for the user-entered hours to be accumulated and reported on generally (e.g., the number of labor hours by program code, by individual users, or by training type) and/or by case (e.g., number of labor hours spent on an individual case by assigned or assisting roles).

TLT5. The system must track hours worked and calculate unscheduled duty (per title 5 United States Code § 5545a, Availability pay for criminal investigators, and Title 5 CFR § 550.183(b), Substantial hours requirement).

TLT6. The system must have the ability to create calendars in both summary and detailed formats and assign the calendars to an individual or group of users (e.g., training calendar or duty agent calendar). The system must show the relevant calendars on an individual's dashboard.

TLT7. The system must allow appropriate users to certify time entries.

Auditing Functions

AF1. The system will have audit capabilities to track user activities. This includes logging changes made to cases and case information, with relevant time stamps and date stamps and a record of user activities. The access to and ability to edit, delete, or clear the audit log information must be restricted to a specific role.

AF2. The system must maintain a history of changes made to case types.

AF3. The system must maintain a complete history of all participation in all cases by any user/person.

AF4. The system must provide a complete audit trail of updates. It must include (but is not limited to including) date and time stamps for all changes made, the person making the change, and the date element that was changed. This includes any and all system changes made by the vendor that may affect the integrity of the data.

AF5. The system must have the ability to generate audit trail reports for quality assurance purposes and provide multilayer security over access to the audit trail.

AF6. The system must have an inventory module that allows entry of records for items and assignment/correlation of items to the staff members who possess those items.

AF7. The system must have staff records for individual users. These staff records must be able to correlate with certain workflow processes as determined by the OIG (e.g., inventory tracking).

AF8. The system must have an event log, an audit log, and a security log accessible only by certain specified users or roles.

Case Management

CM1. The system must allow users with appropriate permissions to initiate a case type (including but not limited to a complaint, preliminary, hotline raw data, or investigation). These categories/types are subject to change or renaming.

CM2. Users with appropriate permissions must be able to open or close a complaint, convert a hotline to a complaint, or take other actions.

CM3. The system must have the ability to assign users to an investigation and specify investigative roles in an investigation (e.g., lead agent).

CM4. The system must have the ability to create associated (spinoff) investigations (e.g., tracking related cases) or associate related investigations.

CM5. The system must retain all case numbers associated or preceding a complaint, lead, or investigation.

CM6. The system must be able to assign multiple violations to each subject/entity in the case and track the violations (e.g., charge/indictment to plea/verdict/adjudication).

CM7. The system must support various case categorization fields, including complaint sources, crime types, proactive/reactive/source generated identifiers, suspect type, and affected program. The OPM OIG will determine which of these fields can have multiple selections.

CM8. The system must allow users to create entities, associate entities with a case, and categorize the entity type within a case (e.g., subject, victim, witness, complainant).

CM9. The system must allow users to change the status of an entity (e.g., witness to subject).

CM10. The system must be capable of recording multiple investigative techniques (e.g., search warrant, wiretap) for a case and the date the investigative technique occurred. This must be able to accommodate multiple activities on the same date for the same case (e.g., multiple warrants executed the same day).

CM11. The system must be able to process a multi-document subpoena workflow process as designated by the OPM OIG.

CM12. The system must be able to sort documents and other case items by type and date.

CM13. The system must maintain and display a running chronology of case events/notes entered by the case agent. This must include who created/added the entry.

CM14. The system must automatically enter events in the case chronology based on the entry of specific information within the case (e.g., when an interview is uploaded, a chronological entry documenting the event is automatically created).

CM15. The system must require supervisory approval for specified case document types.

CM16. The system must allow users with appropriate permission to delete approved documents.

CM17. The system must have a draft/autosave system. The system must automatically delete drafts/revisions of an autosaved document after the document is marked final/approved. The system must have the ability to mass-delete drafts from a case.

CM18. The system must maintain a record or log in the case chronology that logs the changes to case type (e.g., changes from complaint to preliminary to

investigation) and case status (e.g., opened, to closed pending to closed). The log must include the change date, the user performing the action, and the previous and new states.

CM19. The system must be able to associate all interview, indictment, conviction, sentencing, and acceptance/declination documents with an entity in a case.

CM20. The system must be able to logically attach files to documents and number the attachments. (E.g., a memorandum of interview may have a waiver of rights and a document shown during the interview attached to the MOI.)

CM21. The system must have the ability to delete all records associated with an investigation after the records retention period has ended (e.g., 10 years after the end of the fiscal year when the case was closed).

CM22. The system must have the ability to track referrals to other agencies/organizations and the respective outcomes of those referrals.

CM23. The system must provide electronic signature capability, for functions determined by the OPM OIG.

CM24. The system must have the ability to log all preliminary inquiries received by the OPM OIG, regardless of source.

CM25. The system must have the ability to create a preliminary inquiry from a Hotline contact.

CM26. The system must have the ability to create an investigation from a preliminary inquiry.

CM27. The system must allow or automatically link the investigation number to the preliminary inquiry number, if different.

CM28. The system must allow all information from the preliminary inquiry to be accessible and editable after the preliminary inquiry becomes an investigation.

CM29. The system must be able to assign and track multiple administrative actions to each subject in a case.

CM30. The system must be able to assign and track multiple legal actions to each subject in a case.

CM31. The system must be able to assign and track multiple statute and sentencing actions (e.g., fines, assessments, restitution, confinement, probation, supervised release, community service) to each subject in a case.

CM32. The system must be able to assign and track multiple financial results (e.g., recoveries, fines, savings) to each subject in a case.

CM33. The system must be able to designate cases as state or federal and identify partner agencies, including fields to enter/denote which agency is the lead agency and which agencies are assisting.

CM34. The system must be able to host and use electronic templates (e.g., interviews and reports of investigation) with automated population of certain case information.

CM35. The system must assign and track multiple case statuses and properly route the case based on its status.

CM36. The system must have and allow the creation of automated workflow processes with the ability to document, approve, and assign tasks.

CM37. The system must have time and event notifications.

CM38. The system must be able to lock cases to prevent further editing.

CM39. The system must allow closing a case with pending follow-up actions to lock all case information except for the necessary follow-up action/results fields.

CM40. The system must verify that required information is entered prior to allowing a case to close.

CM41. The system must allow for customized case review and case closing actions for investigations.

CM42. The system must allow users to toggle on/off certain notifications selectable from a list. This list must only be creatable/editable by the system administrator.

CM43. The system must have calendar-based notifications for repeating dates (e.g., beginning and end of fiscal year and semiannual reporting periods).

CM44. The system must allow users to download all case documents into a .zip file.

CM45. The system must allow permissioned users to download all case files in a password protected .zip file.

CM46. The system must allow users to select multiple case documents and download those documents into a .zip file.

CM47. The system must have non-investigatory project case or entity types as determined by the OIG (e.g., tracking outreach activity and fraud awareness briefings conducted by special agents not associated with a case.)

CM48. The system will maintain an inventory of evidence, technical equipment, and law enforcement accountable property. This includes identifying the special agent and region the items are assigned to.

CM49. The system must allow users to link entities and create hierarchies of entities that are related to each other (e.g., grouped corporations or franchises).

Records, Reporting, and Searching

RRS1. The system must have robust report generation, including calculation of information such as financial information.

RRS2. The system must allow for Boolean operators in fast search and have a fully indexed search feature.

RRS3. The system architecture must have its data easily searchable and retrievable, with the capability to allow users to find and view data needed for reporting and trend analysis.

RRS4. The system must be able to generate reports on activities and investigations filtered by which OIG personnel conducted or were assigned to an investigation/case.

RRS5. The system must be capable of performing full text searches and retrieving documents based on search inputs.

RRS6. The system must have a quick search function.

RRS7. The system must be able to perform advanced searches with options to provide specific search criteria for most database fields.

RRS8. Users must be able to change search result column displays and ordering. Users must be able to sort columns based on data.

RRS9. The system must be able to produce ad hoc reports based on multiple fields and criteria specified by users. All fields must be searchable (with the ability to limit search functions based on user role.)

RRS10. The system's reporting function must support both date range searches and snapshot searches that capture the current state/status of case entries/information.

RRS11. The system must be able to produce complex ad hoc reports (e.g., all investigations associated with a query of entities, such as all cases where an employee was a subject in the investigation).

RRS12. The system must be able to perform time computations to report information (e.g., days in a specific status, days since the last investigative activity).

RRS13. The system must be able to produce reports in various formats (including but not limited to PDF and Excel/.csv format).

RRS14. The system must be able to save ad hoc reports, including the search criteria used and the fields included. The system must allow quick access for future use of these reports.

RRS15. The system must allow users to create and produce common reports (in multiple formats) to meet the requirements of the Semiannual Report to Congress, the CIGIE report, and other regularly repeated reporting as determined by the OPM OIG staff.

RRS16. The system must be able to generate a report containing all case fields for a specific case.

RRS17. The contractor will provide a data dictionary (in either Word or Excel). This data dictionary will describe the fields and relationships in the system.

RRS18. The system will provide the capability to generate basic on-demand transactional level reports and summary data on case-related information, including subject information and statistics.

RRS19. The system will have a user-friendly (i.e., not requiring knowledge of a programming language or the intervention of the vendor) way for users to define/create custom reports.

RRS20. The system must automatically run and send via email an .xls or Excel document with reports based on user role (e.g., SAR in-progress sent to designated SAR team).

RRS21. The system must be able to display graphical or visual representation of certain statistics (to be defined by the OPM OIG)

RRS22. The system must be capable of identifying case statistics related to tasks, accomplishments, work effort expended, and other categories during the various stages of the case lifecycle. Case statistics must be generated from key data elements within the case record and case documentation/records.

RRS23. The system must capture and store key performance metrics (e.g., approved reports, seizures, arrests, personnel hours expended on a case). The system must be capable of outputting this data into customizable and standardized reports.

RRS24. The system must be able to produce both detailed and summary lists of financial transactions (e.g., fees, fines, restitution, and monetary judgements). The system must be able to produce this information for specific cases and over specific periods in reports and other outputs.

RRS25. The system must be able to create modify, query/view, delete, and print/export subject records.

RRS26. The system must automatically run and send via email an .xls or Excel document with reports based on user role (e.g., SAR in-progress to SAR team).

RRS27. The system must allow for exception searching to identify fields with user-generated system errors.

RRS28. The system must be capable of creating, modifying, searching, and viewing reports as well as querying, viewing, printing, and exporting reports into various formats (e.g., Word, Excel, .xml, .csv, .pdf). The system must be able to auto-populate defined templates and freeform text. This function must not require vendor assistance.

RRS29. The system must be able to create various reports (e.g., reports of investigation, activity reports, reports of interviews) using a COTS word processing application (e.g., Microsoft Office).

RRS30. The system must allow users to submit a report or form to a supervisor in a form that allows the supervisor to make tracked comments/changes in the document. The user who originated the report must be the final author. (E.g., if a supervisor makes changes to the narrative of the submitted report, it is no longer considered a final draft for approval and the system must route it back with the tracked changes/comments to the originating user in draft status. After the changes are made, the originating user can resubmit the document to the supervisor for review.)

RRS31. The system must allow users to create standardized forms (reports) containing case-related system data.

RRS32. The system must maintain a minimum number of standard forms and templates as defined by the OPM OIG (expected to be approximately 50).

RRS33. The system must allow users to query or search for information that may exist in multiple record types (e.g., subject records, case records, narrative fields, and free-text information associated with cases). The search system must also allow wildcard search options.

RRS34. The system must allow the ability to write, save, and share custom searches, including SQL searches.

RRS35. The system must have lists of allegations, allegation subtypes, case closure reasons, and case categories that are editable by administrative users without the need of the contractor.

Financial Calculations

FC1. The system must be able to calculate certain financial statistics such as lost investment income and investigative costs, based on user inputs and formulas defined and editable by administrative users.

FC2. The system must be capable of performing financial calculations (e.g., calculating lost investment income and/or allocating restitution to the appropriated entity based on system entry).

Timesheet

T1. The system must have a timesheet module that allows staff to download their own (or subordinate employees, based on roles) labor report.

User Training

UT1. The contractor will provide a 508-compliant user manual in Microsoft Word outlining all system functions and using a hyperlinked table of contents for each portion of the manual. This must be delivered when the system is complete.
